

		Subglacial Lake Vostok (SLV) accreted ice. Define the possible sources of microbial communities in these environments and test the hypothesis of ultra-low DOC in SLV.		
Jan-Dec	S	Study the solid mineral inclusions in the SLV accretion ice to decode the depositional conditions, geological ages, and to test the hypothesis of hydrothermal contributions to SLV.	Russia	On-going studies
Jan-Dec	S	Update the inventory of subglacial features.	UK	M Siegert - complete
Sep-Dec	S	Compile available LV data and generate new modeling data sets	Germany	C. Mayer
Jan-Dec	S	Retrieval of further SLV accretion ice for further study by deepening the hole 50 meters	Russia	Postponed until 2005-2006 season
Jan-Dec	S	Over snow radar profiling and reflection seismic experiments near SLV to study lake boundaries, shore bedrock topography, lake bathymetry, sub-ice environments, and to model ice sheet and water	Russia	On-going Studies
